

Lab 05 - Prompt and Specification Pack

Cinematic Grading and Enhancement Measured with PSNR and SSIM Create Short Video Film using AI
(TGS-2020505925) | Version v12.0 | 27 September 2026

Grading and upscaling instructions for image tools and colour pages.

Currency note. Tools and model names are examples of a technique, not endorsements, and AI video features change month to month. The prompt patterns here are tool-neutral. Before relying on a feature, clip length, resolution or price, check the provider's current documentation and terms, and record the model ID and date of every generation you keep.

1. Grade description (for a colour-grading preset or a still edit)

Night-for-night blue hour: cool teal shadows, warm sodium and lantern practicals, lifted blacks kept below 5%, gentle film grain, skin and the yellow raincoat untouched in hue.

2. Upscale only the keepers

Generate every exploratory still and clip at the lowest acceptable resolution. Upscale only approved takes, then re-check SSIM against the draft for plastic skin and halos.
