

Lab 10 - Prompt and Specification Pack

Shot, Motion and Continuity Analytics on the Assembled Sequence Create Short Video Film using AI
(TGS-2020505925) | Version v12.0 | 27 September 2026

Fixes to request when analytics flag a continuity defect.

Currency note. Tools and model names are examples of a technique, not endorsements, and AI video features change month to month. The prompt patterns here are tool-neutral. Before relying on a feature, clip length, resolution or price, check the provider's current documentation and terms, and record the model ID and date of every generation you keep.

1. Regenerate a drifted shot

@mei_sheet_v1 - keep the raincoat exactly the yellow of the reference sheet for the whole shot; no colour change over time. Use the previous clip as the video reference so lighting and motion carry over.

2. Flicker

Regenerate with a locked camera and steady practical light, or deflicker in the editor; re-measure the flicker index after either fix.
