

Lab 12 - Prompt and Specification Pack

Cloud, Local and Hybrid Production Architecture Evaluation Create Short Video Film using AI (TGS-2020505925) | Version v12.0 | 27 September 2026

Questions to ask any AI video platform before it enters the architecture.

Currency note. Tools and model names are examples of a technique, not endorsements, and AI video features change month to month. The prompt patterns here are tool-neutral. Before relying on a feature, clip length, resolution or price, check the provider's current documentation and terms, and record the model ID and date of every generation you keep.

1. Vendor checklist

- Where is data processed and stored, and for how long?
- Are uploads or outputs used for training? Can we opt out?
- What are the commercial-use and likeness terms?
- Is there an API, and is it asynchronous (operation ID + polling or webhook)?
- Which provenance marks are applied (C2PA Content Credentials, invisible watermark)?
- Clip length cap, resolutions, aspect ratios and price per generated second?

2. Disclosure line for delivery

This film was created with the help of generative AI. All characters are fictional.

Set the platform's AI-generated-content label on upload as well.
